

# PiIIX

A visualization platform for patients

DECO3801/7381  
Team Red Panda

# General Description

The name of this application is PillX. This is a kind of app used to narrow down the gap between the patients and professional medical knowledge.

The aim of Pillx:

- Remind people take medicine on time.

- Help people to keep their healthy data records well.

What features PillX has:

- Clear interface.

- Strong function.

- Safe storage.

- Easy to learn.

- Friendly to old people.

# Early research

We made some researches to check whether people experience forgetting taking medicines on time or having missed their healthy data records.

We divide people into different age groups.

- 30

- 31 - 50

- 51 - 60

- 60 -

Here is some main results.

People over 60 that  
experienced forgetting take  
medicine on time

- forget to take medicine on time
- Never forget it

People form 31 to 50 that  
experienced forgetting take  
medicine on time

- forget to take medicine on time
- Never forget it

people under 30 that  
experienced forgetting take  
medicine on time

- forget to take medicine on time
- Never forget it

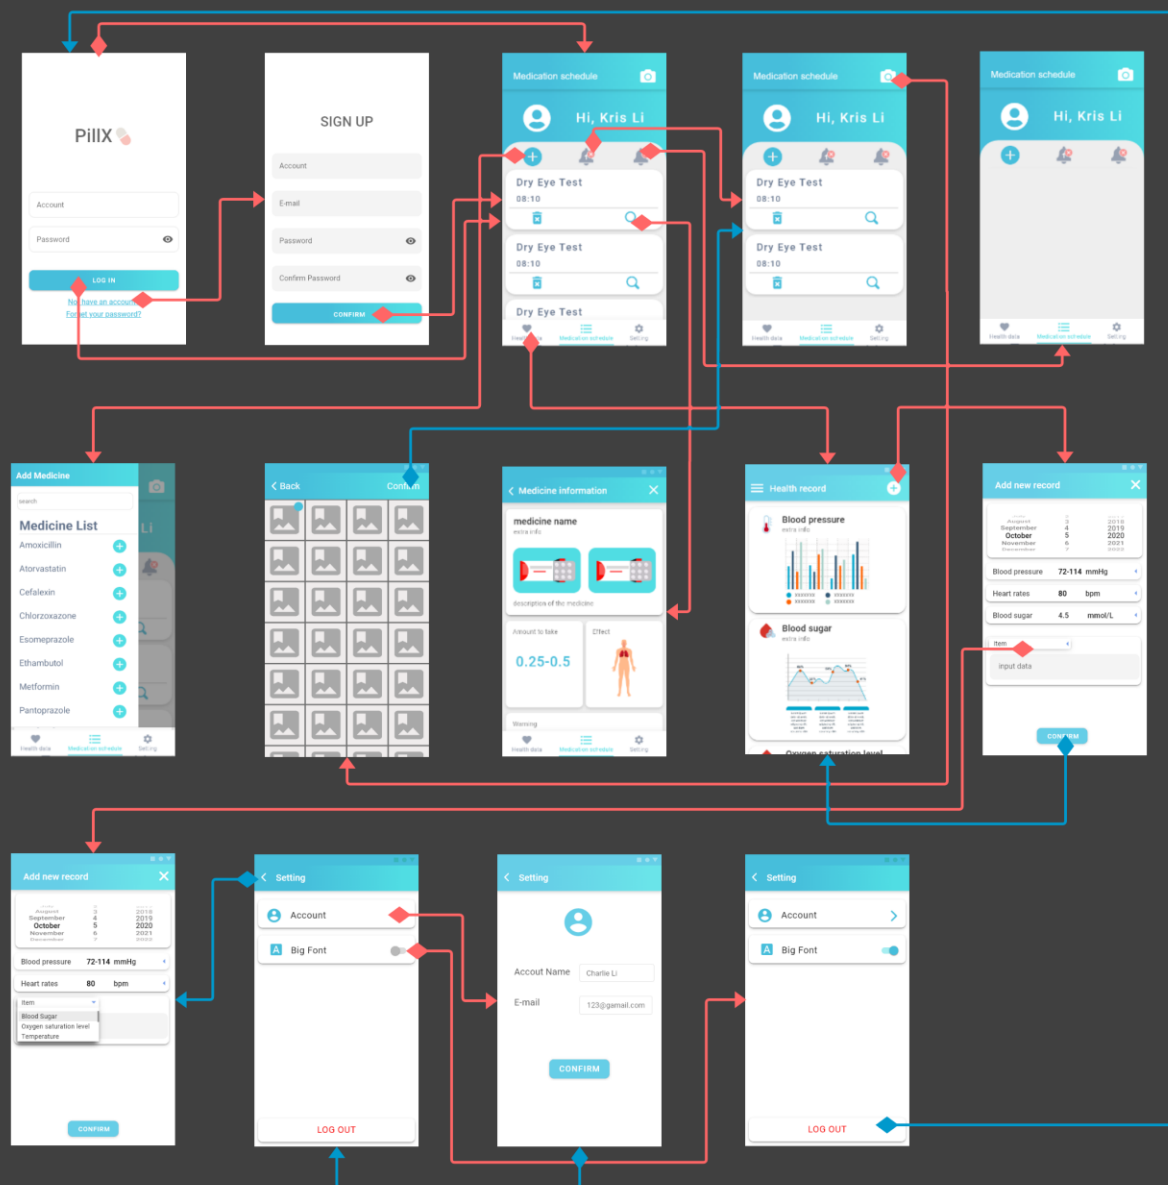

The percentage of families that  
keep members' healthy data  
well

- Keep all the record well and have habits to write down health data
- have lost some healthy records

# User Evaluation

# Interview

To understand the preference of elderly users about APP, the team has interviewed five elderly people who have the experience of using APP and the requirement of having medicine.

- Common problems users have when taking medicine
- Users' opinions about mobile app for timing
- User needs for medication apps and web apps

## Conclusion:

- The eyesight of the elderly has declined, and the size of pictures and words should be taken care of their experience as much as possible.
- The cognitive level of the elderly has declined, and the APP interface needs to be sufficiently guiding.
- They also have functional requirements based on ease of use, but these requirements are also based on reducing the cognitive burden of users.

## Observation

We observed how a 68-year-old couple and a 72-year-old man use mobile phones. According to our observations, the interfaces of these three applications are not suitable for the elderly. They had to wear reading glasses and read hard.

- For the **social APP**, we found that they are very unfamiliar with the operation of finding notifications and editing personal information.
- When using the **reminder APP**, they could not find this feature at first. By our reminder, they found that this feature was activated by sliding down. This shows that the efficiency of searching by inputting text is quite low.
- When using the **Medication Reminder APP**, we found that the elderly is more capable of using the device than we thought. When they performed the operation of deleting the medication reminder, they could not click the icon because it is too small. Lastly, we found that they are using Android phones. So we decided to develop an app based on the Android platform.

## Think Aloud

### Task Objectives:

- Will the existing interface increase the cognitive burden of users?
- Whether the operation process of Medicine schedule users is smooth; whether users have doubts about the interface.
- Whether the health data is sufficiently visualized and easy for users to understand.
- Whether the function of the setting page is lacking/redundant.

Conclusions	Solutions
Heavy cognitive load in medicine schedule page	Simplify every notification chunk in the schedule interface
Cannot find add function	Put add function in top right corner
Confused time setting	Remove time setting in medicine information page
Lack of dosage	Set a prominent area for dosage
